Problem Statement

To promote accountability, ethical behaviour and adherence to fundamental civic duties among citizens, the government wants to design & implement a centralized Social Responsibility & Trust Score Management System. The primary objective of this system is to encourage responsible social conduct by assigning a dynamic Score to each individual based on their compliance with their fundamental duties including but not limited to obeying laws, fulfilling civic responsibilities, participation in social welfare programs and maintaining ethical public behaviour. Higher Scores will be prioritized for certain privileges & benefits such as access to government schemes, loans, awards, promotion and recognitions while Lower Scores will invite warnings, restrictions and penalties. The prime motivation is to hold every individual accountable and responsible for their actions, eventually leading to disciplined, transparent and socially responsible society.

Business Requirements

- The government operates a centralized information system designed to store and manage citizen-related data in a secure and structured manner. Each citizen record includes details such as Citizen ID,Aadhaar Number,fullname,date of birth ,city ,contact information,and the individual's current Social Trust Score.

- To ensure fair evaluation , the system automatically classifies citizens into age groups such as teenagers,adults and senior citizens based on their date of birth.These age Groups help in applying age-specific rules,responsibilities , and eligibility criteria defined by government policies .

- The database also contains a predefined list of social actions that represent a citizen's behavior in society. These actions may include traffic rule violations,timely tax payments,voting participation,involvement in community services , court decisions, public complaints , and participation in government schemes . Each action has a fixed impact on the social trust score,which can either increase or decrease depending on the nature and severity of the action.

- Only authorized government departments and verified officials are allowed to record such actions in the system. After an action is successfully recorded,the citizen's Social Trust Score is updated automatically.Every update is stored in the system so that a proper record of score changes is maintained for transparency and future reference.

- THe system regularly monitors citizens whose trust score falls below a defined limit. In such cases,warnings or penalties may be issued . If negative behavior continues repeatedly , stricter actions such as temporary service restrictions or blacklisting can be applied according to the government rules.

- Citizens who consistently maintain high trust scores are rewarded with certain benefits. These may include faster access to government services , priority in loan approvals , eligibility for welfare schemes , and recognition of social behavior.

- For tracking purposes, the system maintains a complete history of trust score changes for every citizen.This historical data helps authorities study behavior patterns over time and evaluate long-term social responsibility.

- An online citizen portal is also provided where individuals can log in to check their current trust score, view past records , see warnings received ,understand score changes ,and know the benefits they are eligible for. This improves transparency and helps citizens stay informed .

- To ensure data security , the system follows role-based access control . Different users such as administrators,government officials,auditors , and citizens are granted access only according to their assigned roles and permissions.

- The database also supports reporting and analytical features.These allow authorities to generate reports based on cities , regions and action categories . Such analysis helps the government understand overall social behavior trends and assists in making better decisions.

Potential Queries

- List all citizens whose social trust score is below a critical threshold.
- Identify top-ranked citizens eligible for government awards.
- Retrieve score history of a particular citizen over time.
- Count the number of warnings issued city-wise in a given period.
- Find citizens eligible for loan priority based on score criteria.
- Analyze average social score by city or age group.
- Identify repeated offenders with multiple violations.
- Fetch privileges granted to a specific citizen.

Potential Users

- **Government Administrators** – Manage system rules, thresholds, privileges, and overall governance.
- **Authorized Government Officials** – Record verified social actions, issue warnings, and update compliance records.
- **Auditors** – Access logs, score history, and reports for transparency and accountability.
- **Citizens** – View personal social score, warnings, benefits, and improvement guidelines.
- **Policy Makers** – Use analytical insights for planning social schemes and reforms.
